CASE assignment 2 (20 points)

Forte Executive Innes & Robinhood

Mini-group Number: __K__

Members	Contribution
Khush Domadiya	Both contribute equally to this report
Amisha Farhana Shaik	Both contribute equally to this report

DUE: Nov-17 (M, 6:00 pm), 2025

Instruction: Please answer the following questions clearly using the output from your data analysis (if necessary). The assignment includes two cases: i) Forte Executive Innes; ii)Robinhood.

Case i): Forte Executive Innes (Conjoint analysis)

Q1): Using conjoint analysis to identify the optimal product concept from among those Forte is considering. Explain how you arrived at your recommendation. (10 points)

Analysis Approach

Using conjoint analysis with preference data from 40 business travelers, we evaluated four hotel concepts (Professional 1, Professional 2, Tourist, and Deluxe) by simulating their predicted market shares against existing competitors (Courtyard by Marriott, Nittany Lion Inn, Atherton Hilton, Toftrees, and Scanticon).

The analysis used the first-choice decision rule to predict market share.

Based on the conjoint analysis simulation results, we recommend that Forte pursue the **Tourist hotel** concept for the State College market.

Predicted market shares and revenue

	Courtyard by Marriott	Nittany Lion Inn	Atherton Hilton	Toftrees	Scanticon	New product	Revenue per unit	Weighted revenue
Base predictions	17.5%	10.0%	6.3%	32.5%	33.8%	N/A	N/A	N/A
...with Professional 1	15.0%	10.0%	5.0%	27.5%	30.0%	12.5%	\$ 99.5	\$ 12.4
...with Professional 2	12.5%	10.0%	6.3%	32.5%	28.8%	10.0%	\$ 100.5	\$ 10.1
...with Tourist	15.0%	7.5%	5.0%	27.5%	32.5%	12.5%	\$ 100.5	\$ 12.6
...with Deluxe	15.0%	7.5%	5.0%	32.5%	30.0%	10.0%	\$ 98.5	\$ 9.9

Simulation results. Predicted market shares, revenue per unit, and weighted revenue (i.e., revenue per unit multiplied by predicted market shares) for each new product.

Rationale:

The Tourist concept achieves the highest weighted revenue at \$12.6, indicating the best combination of market appeal and profitability.

Hence, we believe it would have the below key advantages:

1. Strong market capture: Tied for the highest predicted market share (12.5%) with Professional 1
2. Optimal feature mix: Large room, speaker phone, exercise room + pool, tape library, and no restaurant delivery appeals to both leisure and business travelers

- While Professional 1 also captures 12.5% market share, the Tourist concept's slightly higher revenue per unit, it gives it the edge in overall profitability.

Q2a) Show Word Cloud (with stem) from “before data,” “during data” and “after data,” and briefly discuss the differences. (2 point)

- [illegible]

- Word cloud of the most frequent words

- **After Data**

Word Cloud Analysis - Before, During, and After:

The word clouds reveal distinct shifts in discourse across the three periods.

Before: The conversation centered on general trading with "stock," "free," "link," "join," and "stockstowatch" as dominant terms, reflecting routine platform promotion and investment discussions.

During: While "stock" remained the largest term, "gamestop" and "amc" became much more prominent alongside controversy-related words like "buy," "money," "suspend," and "restrict," indicating the trading halt crisis.

After: The discourse shifted again with "dogecoin" becoming the second-largest term after "stock," suggesting users moved focus to cryptocurrency trading following the controversy, while "gamestop" remained visible but less dominant than during the event period.

Q2b) Show Valence analysis output from “before data” “during data” and “after data,” and briefly discuss the differences. (4 points)

- **Before Data**

- During Data

Valence analysis

Valence repartition

	Posts count	Relative posts count
Total	4 997	100%
negative	2 498	50%
neutral	941	19%
positive	1 558	31%

- **After Data**

Valence analysis		
Valence repartition		
	Posts count	Relative posts count
Total	4 996	100%
negative	1 717	34%
neutral	1 108	22%
positive	2 171	43%

In the valence analysis, the “before” data revealed a mostly positive outlook, with positive posts making up over half of the sentiment and negative posts around eighteen percent, reflecting general optimism and trust before the critical event; during the most intense period, negative sentiments surged to half of all posts, positive sharing fell to about thirty-one percent, and neutrality dropped, capturing widespread concern and intense criticism; after the event passed, the mood generally brightened again, with the share of positive posts climbing to forty-three percent and negative posts settling at thirty-four percent, showing improving confidence and a shift back toward optimism while some skepticism lingered.

Q2c) Show Emotion analysis output from “before data” “during data” and “after data,” and briefly discuss the differences. (4 points)

- **Before Data**

Emotion analysis

Emotion repartition

	Posts count	Relative posts count
Total	4 998.00	100%
anger	588.64	12%
anticipation	786.8	16%
disgust	483.86	10%
fear	463.04	9%
joy	561.69	11%
sadness	484.97	10%
surprise	446.15	9%
trust	1 182.85	24%

- During Data

Emotion analysis

Emotion repartition

	Posts count	Relative posts count
Total	4 997.00	100%
anger	702.54	14%
anticipation	668.24	13%
disgust	466.33	9%
fear	782.34	16%
joy	444.02	9%
sadness	540.82	11%
surprise	410.01	8%
trust	982.69	20%

- After Data

Emotion analysis

Emotion repartition

	Posts count	Relative posts count
Total	4 996.00	100%
anger	600.37	12%
anticipation	782.18	16%
disgust	406.24	8%
fear	628.5	13%
joy	452.38	9%
sadness	582	12%
surprise	396.87	8%
trust	1 147.47	23%

The emotion analysis across the “before,” “during,” and “after” data shows a dynamic shift in user sentiments in line with the major events in the case: before the event, trust (24%) and anticipation (16%) were the most prevalent emotions, with anger, sadness, and joy each representing close to 10-12% of the posts; during the peak crisis period, trust dropped to 20% while anger (14%), fear (16%), and anticipation (13%) rose, indicating heightened anxiety and

negativity; after the resolution, trust rebounded as the most dominant emotion at 23%, accompanied by increased anticipation (16%) and steady levels of anger, sadness, and joy, reflecting a partial restoration of confidence but persistent mixed feelings these patterns closely mirror the emotional arcs documented in the Robinhood case study, where public trust sharply declined at the crisis peak and gradually returned as corrective actions were taken.
